

The same 5,000+ trades, priced three ways: only one was observed

Reconstructions A and B model a price that was never quoted; the truth lies between them.

A and B reconstructed the exit from a constant-maturity surface: A omitted time decay entirely, B over-corrected it.

Only the third prices the actual held contract from its real quoted bid/ask on both dates (98.9% match rate).

Even so, the observed entry half-spread is 18.8% of mid (median) - so the +3.85% mid-to-mid edge is not capturable.

Sources: +9.96% and -11.74% from results/gate_log.md (K1 CORRECTED entry). +3.85% from src/37_k1_signal_construction_real_prices.py console output.
