

The 10-day surface tenor barely exists; the 30-day tenor is nearly universal

V1/V2 universe, DEV 2015-2021, size deciles 6/7/8. "Both" traces exactly on top of "10-day" (dashed over solid, same value in every year x decile cell) because 10-day availability is a strict subset of 30-day, confirmed structurally - not an approximation.

Source: results/47_v3_iv_tenor_coverage.json, written by src/47_v3_data_feasibility.py STEP 4 (2026-08-02 20:43:38). Overall: 30d=91.45%, 10d=both=4.30%. Descriptive of IV data availability only - no return, RV, or regression quantity is shown. This figure motivates prereg_V3.md section 3.3-F's decision to move V3's primary horizon from 10 trading days to 30 calendar days.
